Decoding the Amazon Marketplace

A Data-Driven Business Case for PandaMonium Goods

Data Source: [Kaggle Amazon Sales Dataset](#)

Claire & Zidene

The Business Challenge

Finding high-margin entry points in a crowded digital landscape

Strategic Hypotheses

Price & Quality

Hypothesis 1: High product pricing naturally signals premium quality:
⇒ what are the reviewer's sentiments towards the products and how pricing affects the user experience?

Discount Anchor

Hypothesis 2: Substantial discount rates drive customer ratings up due to the perception of having received a good deal.

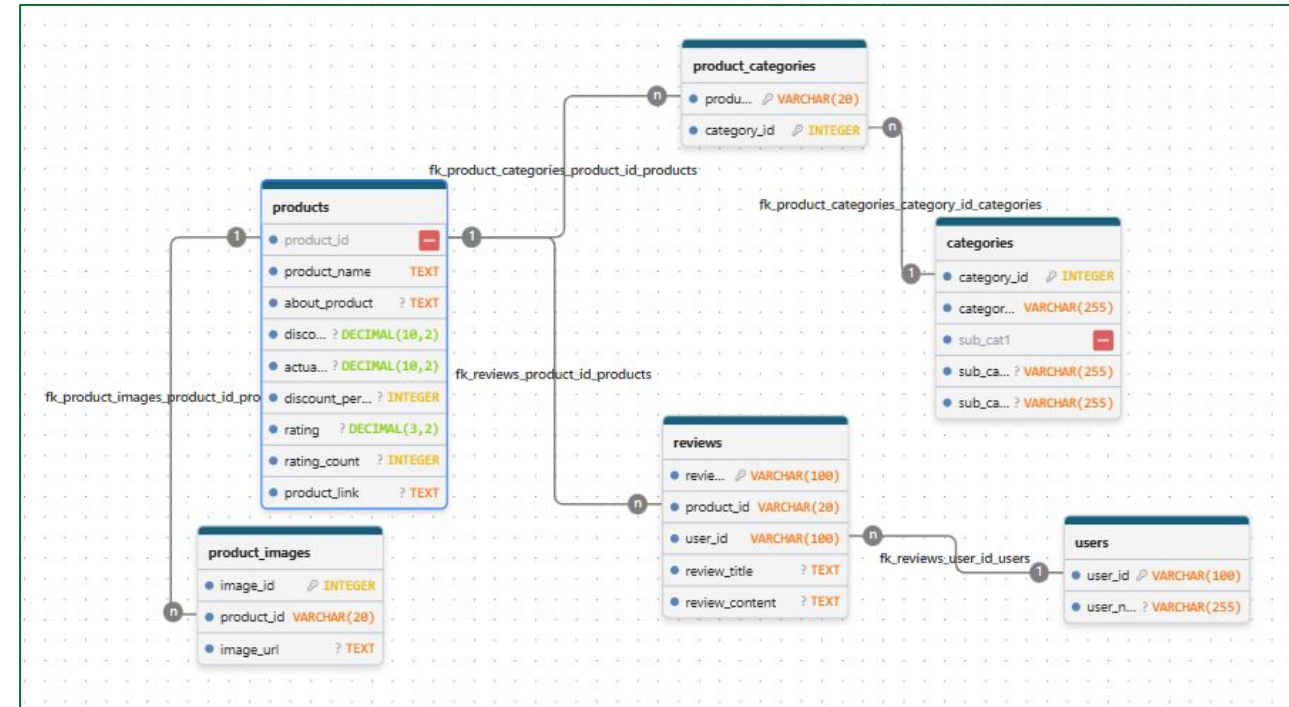

Market Gaps

Hypothesis 3: Low product availability coupled with high review volume and low satisfaction indicate an underserved niche.

Dataset Overview:

- ✓ **Scope:** 1,335 validated Amazon product listings.
- ✓ **Metrics:** Pricing, customer ratings, and review density.
- ✓ **Objective:** Discover correlations between discounting, pricing tiers, customer satisfaction and demand.

Sentiment Overview by Category:

✓ Summary

- Overall sentiment is very positive.
- High-performing categories show stability and reliability

✓ Office Products

- Very high median (~4.3–4.5)
- Tight box (low variability)

✓ Computers_Accessories

- High median (~4.3–4.6)
- Slight spread but still strong

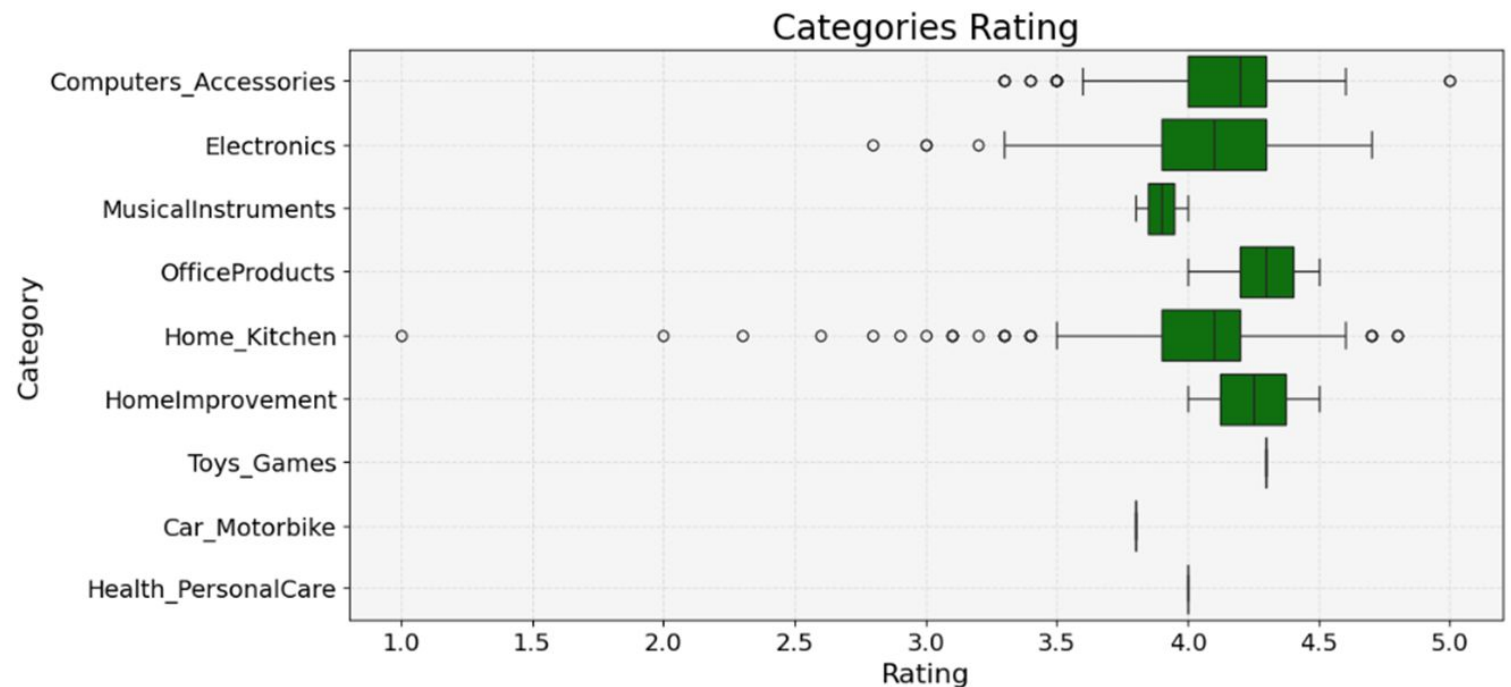

✓ Insight:

- These categories are reliable high-quality segments

✓ Home_Improvement

- Also consistently high

✓ Home & Kitchen needs segmentation and quality review

Rating Distribution by Price Segments:

✓ Premium products deliver the highest satisfaction

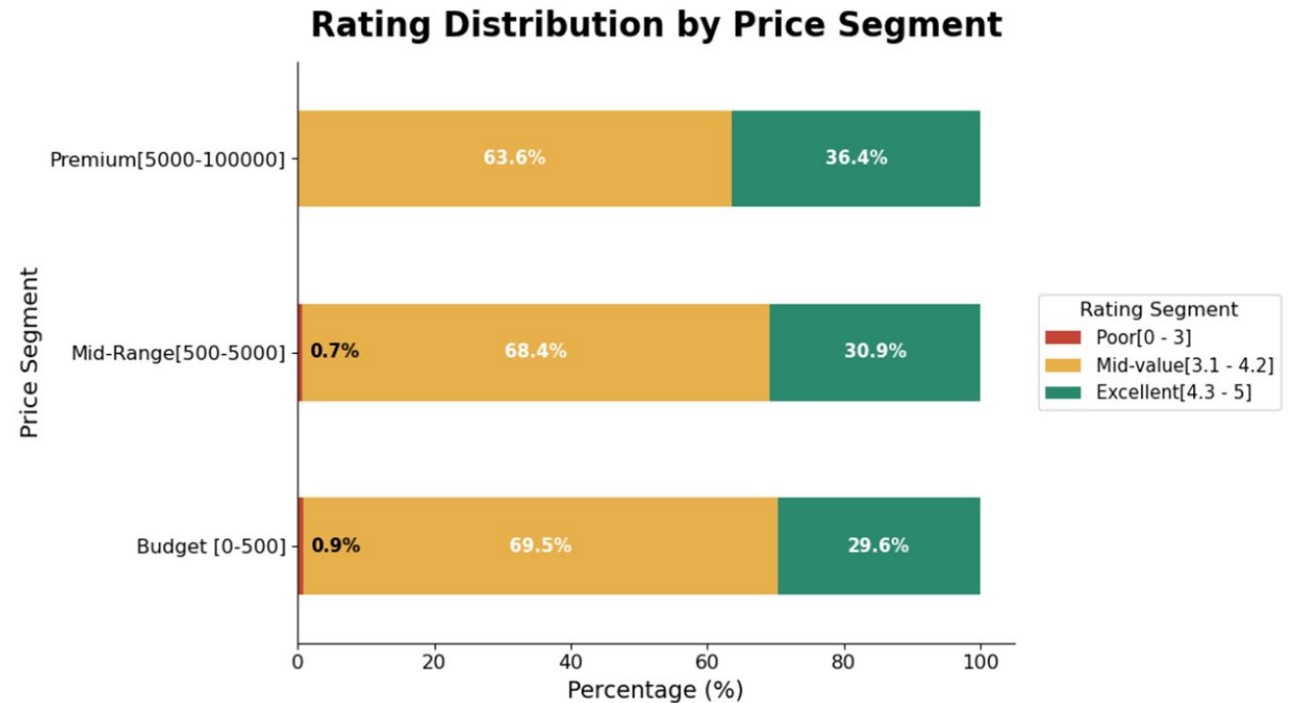

- Excellent ratings dominate the premium segment
- Poor ratings are nearly nonexistent
- Indicates strong perceived value at higher price points

✓ Mid-range products show balanced performance

- Majority of ratings fall in the “Mid-value” band till a meaningful share of excellent ratings
- Represents the *largest* and most competitive segment

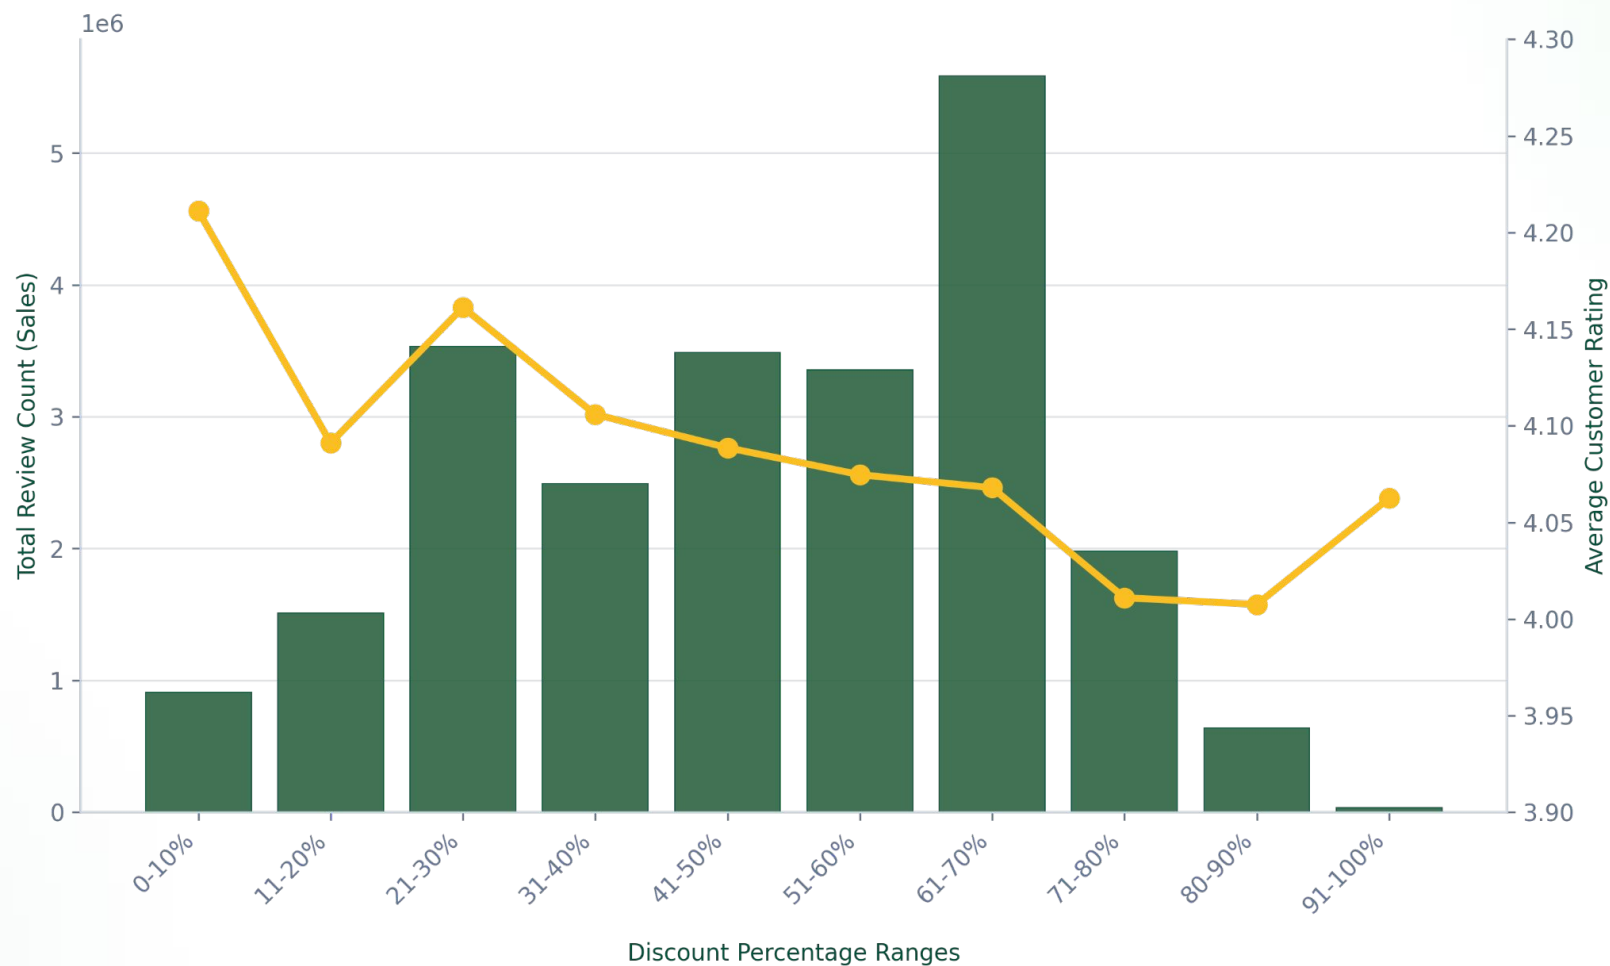

✓ Budget products lean toward average ratings

- Higher proportion of mid-value ratings
- Excellent ratings exist but are less frequent
- Suggests expectations are met but rarely exceeded

H2: The Discount Trap

Sales vs. Consumer Sentiment

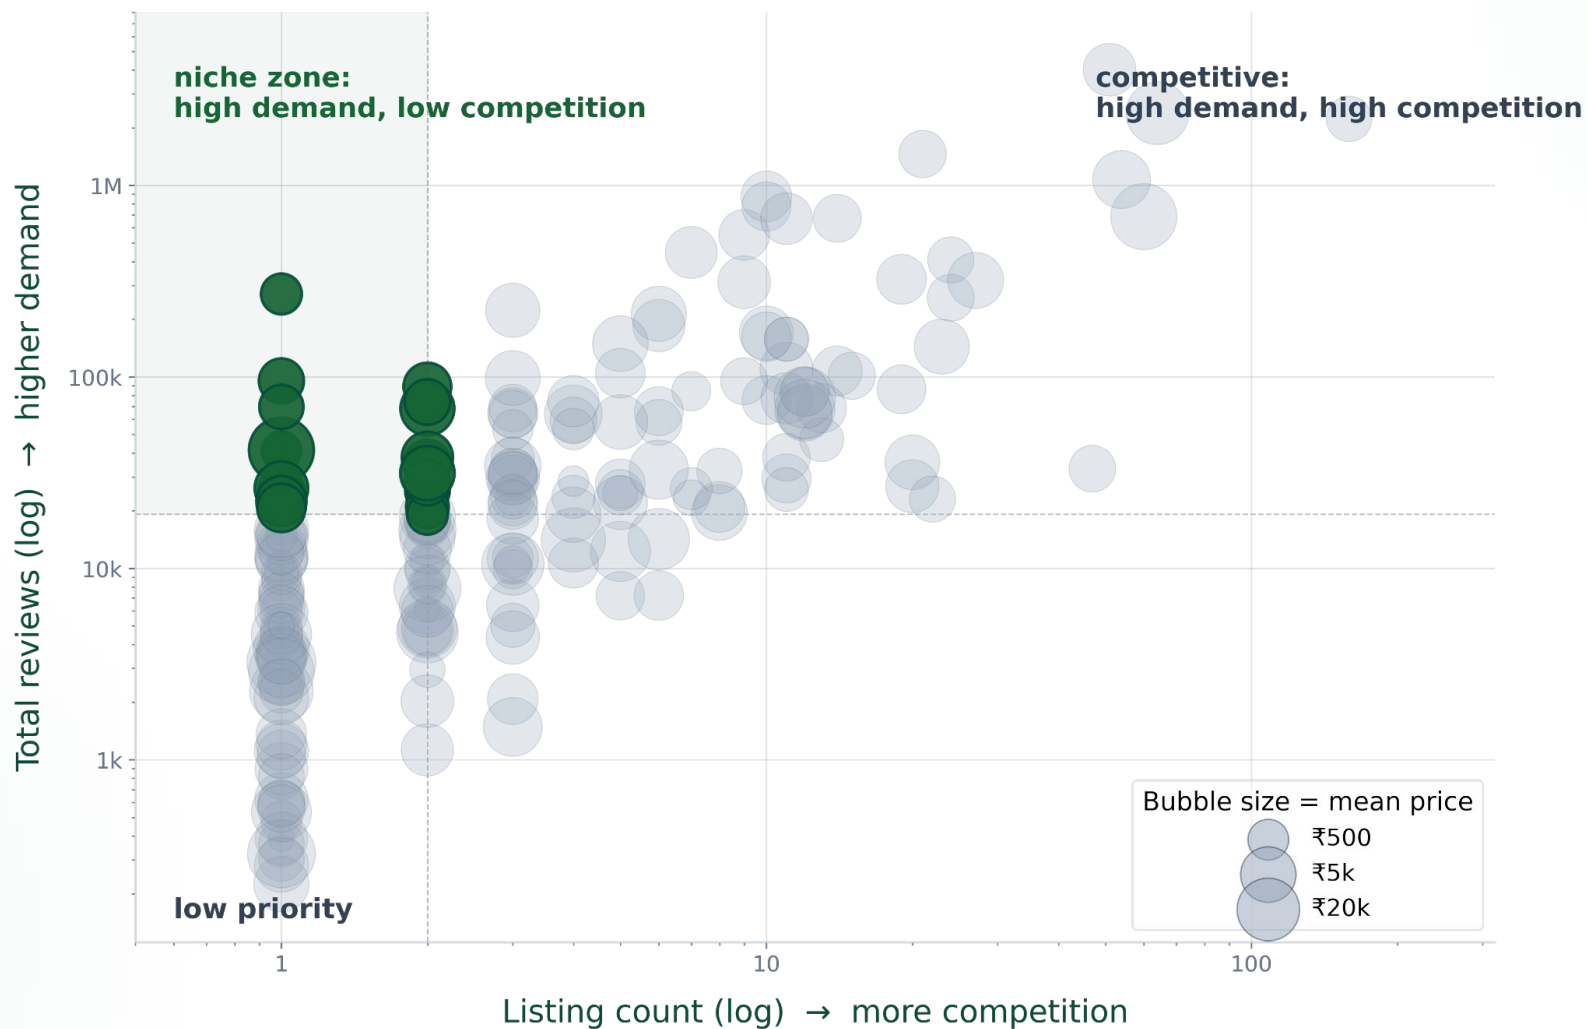

The "Rating Cliff": Value perception decreases with heavy discounting.

Does not impede sales below 70%.

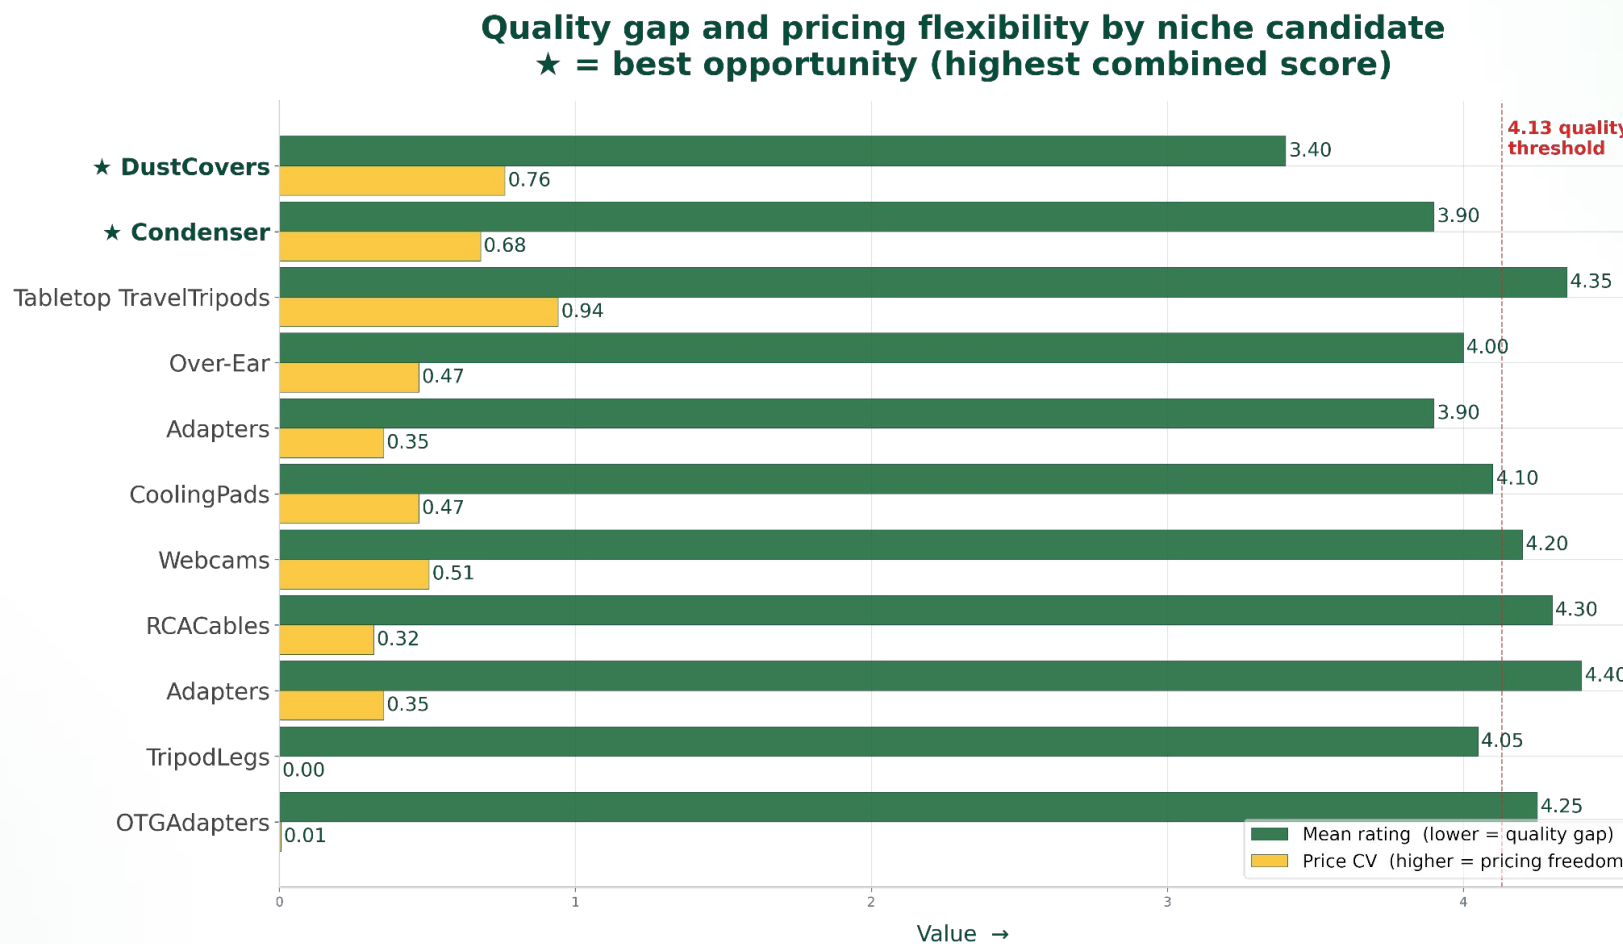

H3: Determining Potentially Underserved Niches

Niche candidates: high demand, low competition

H3: Identifying High Opportunity Products

The "sweet spot": below average quality offerings & high price variability.

Categories where demand for higher quality exists alongside the freedom to introduce premium pricing.

Scoring = average of [1 - rating] and CV

| Obstacles:

- ✗ **Lack of Clear Sales Data:** Relied on number of reviews as a proxy for popularity.
- ✗ **Lack of Clear Timeline:** Not clear over what timespan the data was collected, cannot project sales.
- ✗ **Poor Data Structure:** Multiple columns with concatenated values.
- ✗ **Lack of Clarity on Pricing:** Unclear whether all reviewers purchased at the discounted price.
- ✗ **Lack of Rating Diversity:** Most of the products rated around 4 *.

| Conclusions

- ✓ **Premium Pricing:** Expensive products have a higher proportion of “Excellent” ratings.
- ✓ **Promotional Guardrails:** Enforce a strict 65% discount cap to balance sales and ratings.
- ✓ **Avoid Saturated Markets:** Skip categories where competitors have large numbers of reviews and vast portfolios.
- ✓ **Look for Flexible Pricing:** Choose product areas where pricing shows high variability to avoid price wars.
